KEY TO THE GENERA OF COMMON APHIDS

IN IRAN (1)

V.F.EASTOP (2) and H.HODJAT (3)

SUMMARY

Identifying alate viviparae aphids is an important primary task for research on aphid pests or vectors of Plant viruses studies. Aphids collected from yellow trays or plants especially in Khuzistan, South West of Iran and Nowshahr, north of Iran, were identified in the British Museum and are included in this key. The key contains only 38 genera of common aphids and does not include all known genera of aphids in Iran. Research to complete this study is proceeding.
