

## **BIOLOGY AND CONTROL OF SAN JOSE SCALE IN GUILAN PROVINCE (1)**

A. HABIBIAN (2)

### **SUMMARY**

According to four years investigations in Guilan (1970-1973) this insect has four annual generations.

Hibernation occurs in the form of second instar larvae of the fourth generation.

To control the population of this pest if oil is added to the phosphorous insecticides, better results are obtained.

(See the tables in Farsi text represented in both Farsi and English languages).
